

(a) Naive composition

One boundary, two bad choices

Keep group control flow

Reuse the async stream unchanged

arrival order acts before context is complete

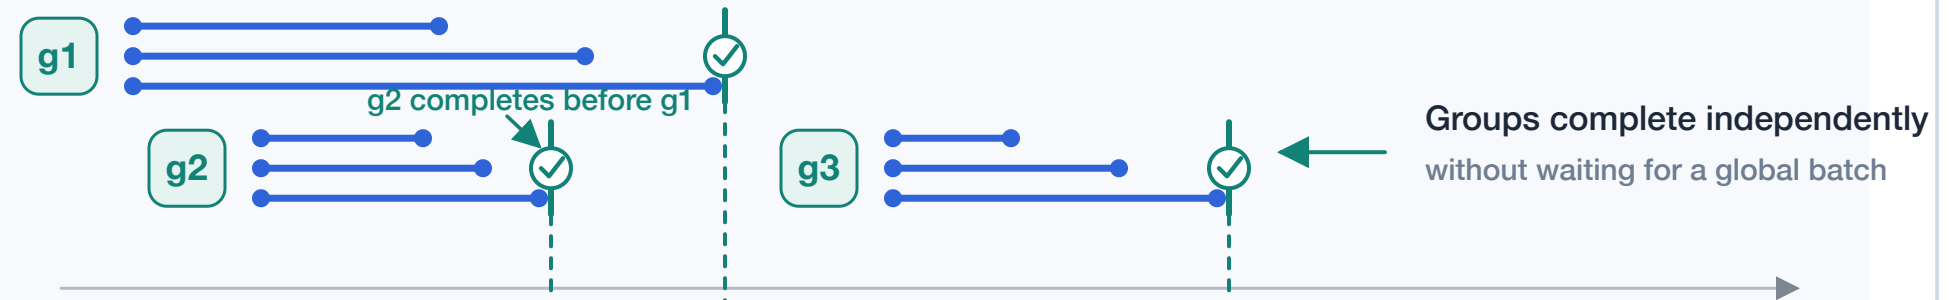

Learning composition is rewritten

A naive merge must sacrifice
execution or learning meaning

(b) StreamWeave

Keep complete context local; keep the pipeline moving globally

1 EXECUTE independently

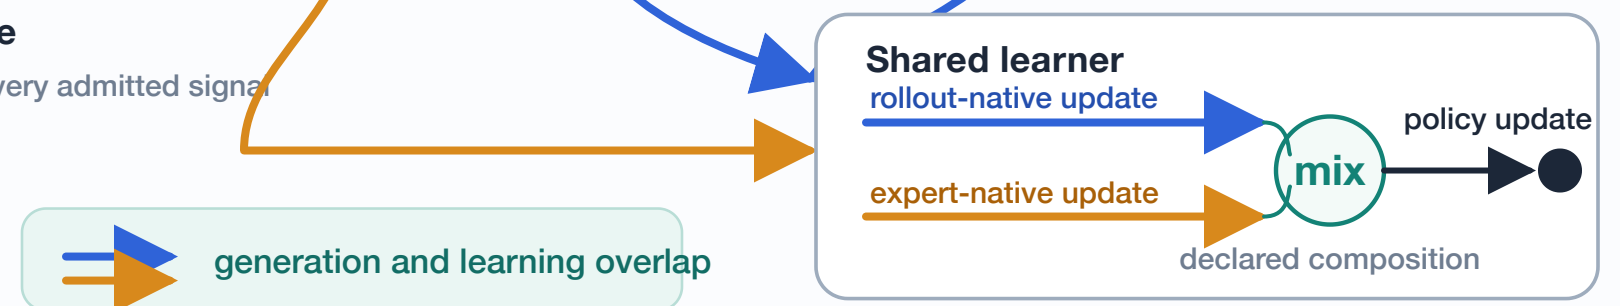

2 DECIDE with complete context

3 LEARN by source

context travels with every admitted signal

Preserve learning boundaries without restoring execution barriers.
